## tesamorelin (Egrifta SV<sup>®</sup>)

Policy # 00454

Original Effective Date: 06/17/2015

Current Effective Date: 07/08/2024

*Applies to all products administered or underwritten by Blue Cross and Blue Shield of Louisiana and its subsidiary, HMO Louisiana, Inc. (collectively referred to as the "Company"), unless otherwise provided in the applicable contract. Medical technology is constantly evolving, and we reserve the right to review and update Medical Policy periodically.*

### When Services Are Considered Not Medically Necessary

Based on review of available data, the Company considers the use of tesamorelin (Egrifta SV<sup>®</sup>)<sup>‡</sup> for the reduction of excess abdominal fat in HIV (human immunodeficiency virus)-infected patients with lipodystrophy to be **not medically necessary**.\*\*

### When Services Are Considered Investigational

*Coverage is not available for investigational medical treatments or procedures, drugs, devices or biological products.*

Based on review of available data, the Company considers the use of tesamorelin (Egrifta SV) for indications other than the reduction of excess abdominal fat in HIV infected patients with lipodystrophy to be **investigational**.\*

### Background/Overview

Egrifta SV is a growth hormone releasing factor (GRF) analog indicated for the reduction of excess abdominal fat in HIV-infected patients with lipodystrophy. Growth hormone releasing factor, also known as growth hormone-releasing hormone (GHRH), is a hypothalamic peptide that acts on the pituitary somatotroph cells to stimulate the synthesis and pulsatile release of endogenous growth hormone (GH), which is both anabolic and lipolytic. Growth hormone exerts its effects by interacting with specific receptors on a variety of target cells, including chondrocytes, osteoblasts, myocytes, hepatocytes, and adipocytes, resulting in a host of pharmacodynamic effects. Some, but not all these effects, are primarily mediated by insulin like growth factor-1 (IGF-1) produced in the liver and in peripheral tissues. Upon initial approval, Egrifta was available as a 1 mg per vial formulation with a recommended dose of 2mg injected subcutaneously once daily. In 2018, Egrifta SV became available as 2 mg per vial with a recommended dose of 1.4 mg subcutaneously once daily. These two formulations also have differing reconstitution instructions, storage requirements, and number of vials required to prepare a dose. In August of 2020, Egrifta was discontinued. Long-term

cardiovascular benefit and safety of Egrifta SV have not been studied. Egrifta SV is not indicated for weight loss management. There are no data to support improved compliance with anti-retroviral therapies in HIV-positive patients taking Egrifta SV.

## **FDA or Other Governmental Regulatory Approval**

### **U.S. Food and Drug Administration (FDA)**

Egrifta SV is a growth hormone releasing factor analog indicated for the reduction of excess abdominal fat in HIV-infected patients with lipodystrophy. Egrifta was initially approved by the FDA in November of 2010. In November of 2018, Egrifta changed its proprietary name to Egrifta SV.

## **Rationale/Source**

This medical policy was developed through consideration of peer-reviewed medical literature generally recognized by the relevant medical community, U.S. Food and Drug Administration approval status, nationally accepted standards of medical practice and accepted standards of medical practice in this community, technology evaluation centers, reference to federal regulations, other plan medical policies, and accredited national guidelines.

Egrifta was studied in two phase III, randomized, placebo-controlled trials in HIV infected patients with excess abdominal fat. Both trials had 26 week randomized main phases, and then patients were re-randomized in extension phases until week 52. The primary endpoint of the studies was the percent change from baseline to week 26 in visceral adipose tissue (VAT), assessed via computed tomography (CT) scan at the L4-L5 vertebral level. The mean change in VAT was -18% in the Egrifta group and +2% in the placebo group in study 1 and -14% in the Egrifta group and -2% in the placebo group in study 2. The mean treatment differences were statistically significant in both study 1 (-20%) and study 2 (-12%). Eligible patients were then moved to an extension phase. Patients that received Egrifta in the main phase were re-randomized in study 1 and study 2 to either Egrifta or placebo. Those that received placebo during the main phase received Egrifta during the extension phase. The purpose of the extension phase was to assess maintenance of VAT reduction and to gather long-term safety data. The mean change in VAT from week 26 to week 52 in those patients continuing on Egrifta was 0% and +22% for those that switched from placebo to Egrifta in study 1. The mean change in VAT from week 26 to week 52 in those patients continuing on Egrifta was -5%

and +16% for those that switched from placebo to Egrifta in study 2. The mean treatment differences were statistically significant in study 1 (-17%) and study 2 (-18%).

Although Egrifta is FDA approved for the reduction of excess abdominal fat in HIV-infected patients with lipodystrophy, an improvement in net health outcomes has not been demonstrated. The long-term cardiovascular benefit of Egrifta has not been studied. Secondary endpoints such as lipid abnormalities and improved patient-reported body image were considered correlates of VAT reduction, however changes in these measures were not robust or consistent. Therefore, Egrifta is considered not medically necessary for the reduction of excess abdominal fat in HIV-infected patients with lipodystrophy as there is insufficient peer reviewed literature to support improvement in health outcomes.

**\*Investigational** – A medical treatment, procedure, drug, device, or biological product is Investigational if the effectiveness has not been clearly tested and it has not been incorporated into standard medical practice. Any determination we make that a medical treatment, procedure, drug, device, or biological product is Investigational will be based on a consideration of the following:

- A. Whether the medical treatment, procedure, drug, device, or biological product can be lawfully marketed without approval of the U.S. Food and Drug Administration (FDA) and whether such approval has been granted at the time the medical treatment, procedure, drug, device, or biological product is sought to be furnished; or
- B. Whether the medical treatment, procedure, drug, device, or biological product requires further studies or clinical trials to determine its maximum tolerated dose, toxicity, safety, effectiveness, or effectiveness as compared with the standard means of treatment or diagnosis, must improve health outcomes, according to the consensus of opinion among experts as shown by reliable evidence, including:

**Policy #** 00454

**Original Effective Date:** 06/17/2015

**Current Effective Date:** 07/08/2024

1. Consultation with technology evaluation center(s);
2. Credible scientific evidence published in peer-reviewed medical literature generally recognized by the relevant medical community; or
3. Reference to federal regulations.

**\*\*Medically Necessary (or “Medical Necessity”)** - Health care services, treatment, procedures, equipment, drugs, devices, items or supplies that a Provider, exercising prudent clinical judgment, would provide to a patient for the purpose of preventing, evaluating, diagnosing or treating an illness, injury, disease or its symptoms, and that are:

- A. In accordance with nationally accepted standards of medical practice;
- B. Clinically appropriate, in terms of type, frequency, extent, level of care, site and duration, and considered effective for the patient's illness, injury or disease; and
- C. Not primarily for the personal comfort or convenience of the patient, physician or other health care provider, and not more costly than an alternative service or sequence of services at least as likely to produce equivalent therapeutic or diagnostic results as to the diagnosis or treatment of that patient's illness, injury or disease.

For these purposes, “nationally accepted standards of medical practice” means standards that are based on credible scientific evidence published in peer-reviewed medical literature generally recognized by the relevant medical community, Physician Specialty Society recommendations and the views of Physicians practicing in relevant clinical areas and any other relevant factors.
